2 How to prove things

1. Prove the following statements; what is the negation of each of these statements?

- (a) For every integer x , if x is even, then for every integer y , xy is even.

Proof. Since x is even, choose an integer w such that $x = 2w$.

Then, $xy = 2wy$.

Let $z = wy$; then $xy = 2z$, so xy is even. \square

- (b) For every integer x and for every integer y , if x is odd and y is odd then $x + y$ is even.

Proof. Since x is odd, choose an integer v such that $x = 2v + 1$. Since

y is odd, choose an integer w such that $y = 2w + 1$.

Then, $x + y = 2v + 2w + 2$.

Let $z = v + w + 1$; then $x + y = 2z$, so $x + y$ is even. \square

- (c) For every integer x , if x is odd then x^3 is odd.

Proof. Since x is odd, choose an integer w such that $x = 2w + 1$.

Then, $x^3 = 8w^3 + 12w^2 + 6w + 1$.

Let $z = 4w^3 + 6w^2 + 3w$; then $x^3 = 2z + 1$, so x^3 is odd. \square

2. Prove that for every integer x , $x + 4$ is odd if and only if $x + 7$ is even.

Proof. (\Rightarrow) Suppose $x + 4$ is odd.

Choose an integer v such that $x + 4 = 2v + 1$.

Then, $x + 7 = 2v + 4$.

Let $z = v + 2$; then $x + 7 = 2z$, so $x + 7$ is even.

(\Leftarrow) Suppose $x + 7$ is even.

Choose an integer w such that $x + 7 = 2w$.

Then, $x + 4 = 2w - 3 = 2(w - 2) + 1$.

Let $z = w - 2$; then $x + 4 = 2z + 1$, so $x + 4$ is odd. \square

- 31 3. Figure out whether the statement we negated in §1.3 is true or false, and
32 prove it (or its negation).
- 33 4. Prove that for every integer x , if x is odd then there exists an integer y
34 such that $x^2 = 8y + 1$.
